EXP 10: Performance Optimization in Zoho Creator

AIM

To study and implement performance optimization techniques in Zoho Creator to improve application speed, reduce loading time, minimize unnecessary workflows, and enhance the overall efficiency of the Loan Application Management System.

PROBLEM STATEMENT

A financial institution uses a Zoho Creator application to manage loan applications, applicant details, document verification, and loan approval status. As the number of applications increases, the system may become slow because reports retrieve unnecessary records and multiple workflows perform similar operations.

SOLUTION

Performance optimization techniques are proposed to improve the application's response time and efficiency.

• Report Optimization: Apply filters to display only relevant loan application records.

• Workflow Optimization: Remove duplicate workflows and avoid unnecessary triggers.

• Deluge Script Optimization: Reduce repeated database queries and simplify conditions.

• Form Optimization: Include only necessary fields and validations.

• Data Retrieval Optimization: Fetch only the required applicant records and fields.

• Testing: Compare application performance before and after optimization.

Expected Result: The Loan Application Management System should load reports faster, execute workflows more efficiently, and provide a better user experience.

EXPECTED OBSERVATION

S. No.	Observation	Result
1	Initial application performance	Reports may load slowly
2	Filters applied to loan reports	Only relevant loan records are displayed
3	Duplicate workflows removed	Unnecessary executions are reduced
4	Deluge scripts optimized	Redundant operations are minimized
5	Application tested after optimization	Improved efficiency is expected

PROCEDURE

1. Log in to Zoho Creator and open the Loan Application Management System.

2. Identify performance issues in the Loan Application form, reports, and workflows.

3. Apply filters to reports to retrieve only the required loan application records.

4. Review duplicate workflows and optimize Deluge scripts where necessary.

5. Reduce unnecessary data retrieval and processing.

6. Test the application and compare its performance before and after optimization.

RESULT

Performance optimization techniques in Zoho Creator were studied for the Loan Application Management System. The proposed optimization methods help reduce unnecessary processing, improve report response time, and increase application efficiency.

CONCLUSION

Thus, performance optimization in Zoho Creator was studied successfully. By optimizing loan application reports, workflows, Deluge scripts, and data retrieval, the application's performance and responsiveness can be improved, resulting in efficient loan application management and a better user experience.
