EXP 12: Security and governance in Zoho Creator

AIM

To study and implement security and governance features in Zoho Creator to protect sensitive loan application data, control user access, and ensure secure application management.

PROBLEM STATEMENT

A financial institution uses Zoho Creator to manage loan applications, applicant details, income information, credit scores, document verification, and loan approval status. Unauthorized access to sensitive applicant information could result in data leakage, misuse, or unauthorized modification of loan records.

SOLUTION

The following security and governance measures are proposed for the Loan Application Management System:

• Administrator: Can manage users, loan applications, and application settings.

• Loan Officer: Can view, verify, and update permitted loan application records.

• Applicant: Can submit loan applications and view only permitted application details.

• Access Control: Configure permissions for loan application forms, reports, and records.

• Data Protection: Restrict access to sensitive applicant details, PAN numbers, income information, and credit scores.

• Monitoring: Review access permissions and audit information where available.

Expected Result: The Loan Application Management System provides controlled access to applicant information and reduces the risk of unauthorized activities.

EXPECTED OBSERVATION

S. No.	Observation	Result
1	User roles created	Access categorized by role
2	Permissions configured	Unauthorized access restricted
3	Record-level access applied	Loan records controlled according to permissions
4	Different roles tested	Access rules verified
5	Security settings reviewed	Application security improved

PROCEDURE

1. Log in to Zoho Creator and open the Loan Application Management System.

2. Create or review user roles such as Administrator, Loan Officer, and Applicant.

3. Configure permission sets to control access to loan application forms, reports, and records.

4. Set appropriate field permissions and record-level access rules to protect sensitive applicant information.

5. Review API access, data visibility, authentication, and application-sharing settings.

6. Test the application using different user roles, where test accounts are available.

7. Verify that users can access only the loan records and application features permitted to them.

RESULT

Security and governance features were studied in Zoho Creator for the Loan Application Management System. A Loan Officer permission set was configured to control access to loan application records, and additional security and administration practices were examined

CONCLUSION

Thus, security and governance in Zoho Creator were studied successfully. Role-based permissions, access controls, authentication, and monitoring help protect sensitive applicant information and ensure secure management of the Loan Application Management System.
